

IELTS Writing Task 1 Band 9 – Adult Education Survey

The bar chart outlines the percentage of adults pursuing further education for seven different reasons, while the pie chart illustrates public opinions on how the costs of adult education should be distributed among individuals, employers and taxpayers.

Overall, personal interest and qualification acquisition are the predominant motivations for adult learning, whereas social factors such as making new friends are the least common incentives. In terms of funding responsibility, individuals are considered the main bearers of adult education costs, followed by employers and taxpayers respectively.

Looking at the study motivations in detail, interest in specific subjects is the most popular reason, chosen by 40% of adult learners. This is marginally higher than the proportion of people studying to gain qualifications, at 38%. Helping with current work (22%) and improving promotion prospects (20%) are also relatively common career-related drivers, alongside enjoying the learning process itself, which also accounts for 20% of respondents. By contrast, fewer adults study to change jobs (12%), and meeting new people is the least prevalent motivation, with only 9% of surveyed adults selecting this reason.

With regard to cost-sharing, 40% of people believe that individual learners should take the largest share of the education expenses. Employers are viewed as the second most responsible party, accounting for 35% of the cost burden. Taxpayers are expected to contribute the smallest proportion, at just 25% of the total adult education costs.
